Flexi Needles are sharp or blunt, with closed-ended needle guides, and have a nominal 0.3 cm long tip. They are made of biologically compatible material. (Custom lengths are available upon request.)

Intended Use:

Flexi Needles are inserted transcutaneously, using special obturators. They are designed to be afterloaded with Iridium-192 or Iodine-125 ribbon sources. Two types of caps are available (Luer Cap or Slip Cap) to place over the loaded Flexi Needle to hold the ribbons in place during irradiation. Simulator sources can be used for localization; obturators are left in place until the time each is afterloaded with the appropriate radioactive source.
